Diagnostic

History of fall or giving way
 High functional discomfort
 Instability

Clinic: No active extension
 Palpable defect

Xr and Ultrasound

Treatment: Goals

- Restore active extension to 0°
- Restore the knee lock
- Correct flexion
- In case of fracture, anatomic reconstruction

Treatment options

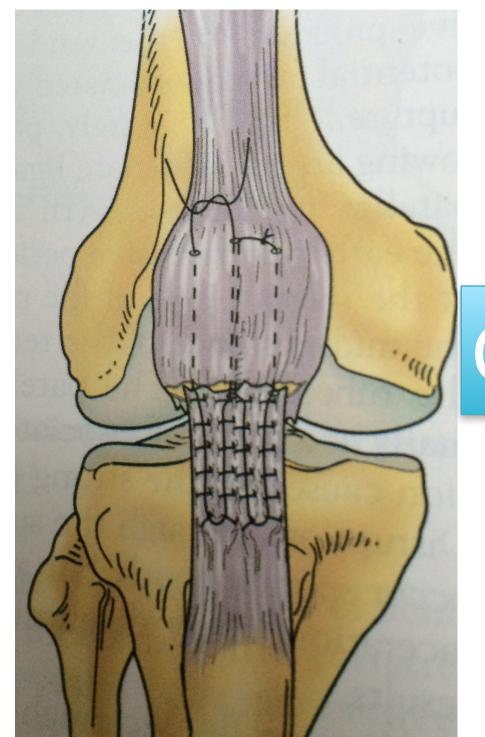

ORIF

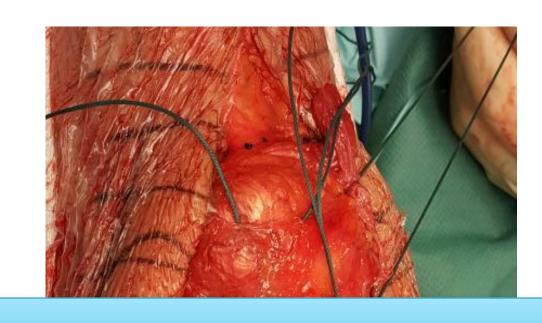

Augmentation

cable

Autogreffe: Semi-T

non resorbable suture

Tape synthetic

Finn transposition

Allograft:

- Achille tendon
- Massive allograft

Injury. 2017 Dec;48(12):2793-2799. doi: 10.1016/j.injury.2017.10.013. Epub 2017 Oct 16.

Comparison of adverse events and postoperative mobilization following knee extensor mechanism rupture repair: A systematic review and network meta-analysis.

- « Direct suture with an immobilisation in full extension is not anymore the gold standard »
- <u>Consequences</u>: muscle mass loss, stiffness, limited range of motion, very long rehabilitation period, additional complications (DVT, skin laceration,...)
- Immediate mobilisation in all repairs
- Augmented primary repair: best result

Augmentation = Gold Standard

Cable Wire or PDS cord

- cable migration re operation
- beter resistance

Schliemann B¹, Grüneweller N², Yao D³, Kösters C², Lenschow S², Roßlenbroich SB², Raschke MJ², Weimann A².

CONCLUSION: Augmentation of a patellar tendon repair with either a cable wire or a PDS cord provides higher primary stability than suture anchor repair in patellar tendon ruptures. The study supports the use of additional augmentation of a tendon repair in the clinical setting in order to prevent loss of reduction and allow for early post-operative mobilisation.

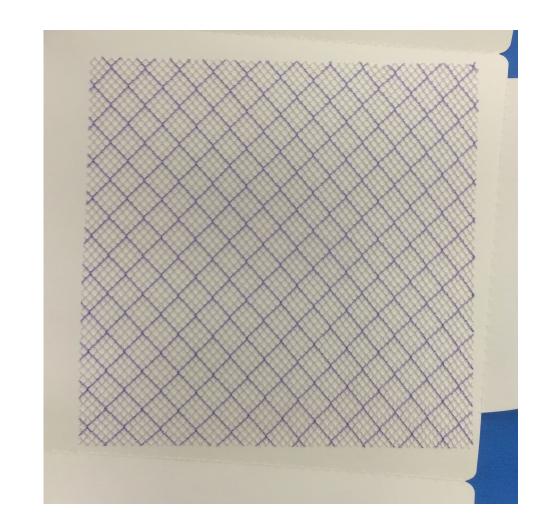

Marlex Tape

Polyethylene terephthalate tape augmentation as a solution in recurrent quadriceps tendon ruptures.

mobilization. Besides being durable, multifilament high tenacity polyethylene terephthalate is flexible. Poly tape augmentation is particularly recommended in the following cases: recurrent rupture of the quadriceps tendon; extensor apparatus damage following total knee arthroplasty (TKA); delayed diagnosis of quadriceps tendon rupture; and in elderly patients (with weak bones and poor ligament quality). The surgical technique is simple and the procedure has a low complication rate. There have been many studies confirming the security of polyethylene terephthalate use in the human body. There is also a great deal of evidence concerning tissue ingrowth in the mesh structure of poly tape. Allergic reactions and inflammatory responses are rare.

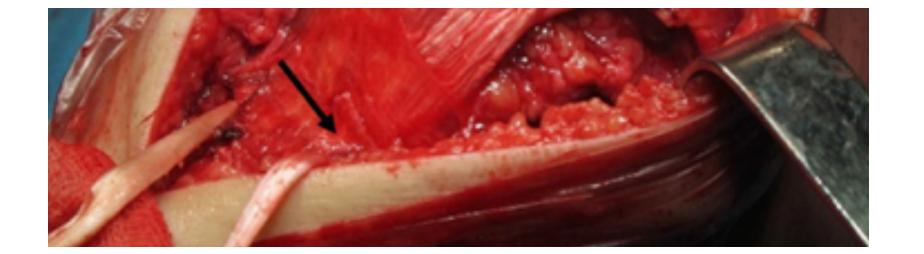

Autograft: semi-tendinus

- autograft- vascularised
- Comorbidities not an option
- Arthrosc Tech. 2017 Nov 13;6(6):e2177-e2181. doi: 10.1016/j.eats.2017.08.013. eCollection 2017 Dec.

Long-term results of extensor mechanism reconstruction using Achilles tendon allograft after total knee arthroplasty

Conclusion

Achilles tendon allograft reconstruction is a reliable and durable treatment for patients who sustain not only patellar tendon ruptures, but also quadriceps tendon ruptures following TKA. Despite the success of this technique, the injury and procedure have a profound impact on overall function.

- vascular supply
- Skin problems
- limited coverage

Augmentation, Which one to use?

CONCLUSIONS: We performed the first network meta-analysis to date comparing treatment of EMRs. Our results support the current body of knowledge that there is no single superior repair method. Although there is an increasing trend towards early or immediate post-operative knee mobilization, we found that early mobilization is associated with significantly higher adverse event and total event rates compared to fixed immobilization for a minimum of 6 weeks, implicating an increased financial burden and decreased quality of life associated with early post-operative mobilization.

Preop analysis for a good strategy

- Type of ruptureco-morbidities
- vascularisation
- skin evaluation

Type of rupture

- Tibial Tuberositas- Patella Tendon-Patella -Quadriceps Tendon
- Native knee- TKP
- Acute trauma- chronique problem

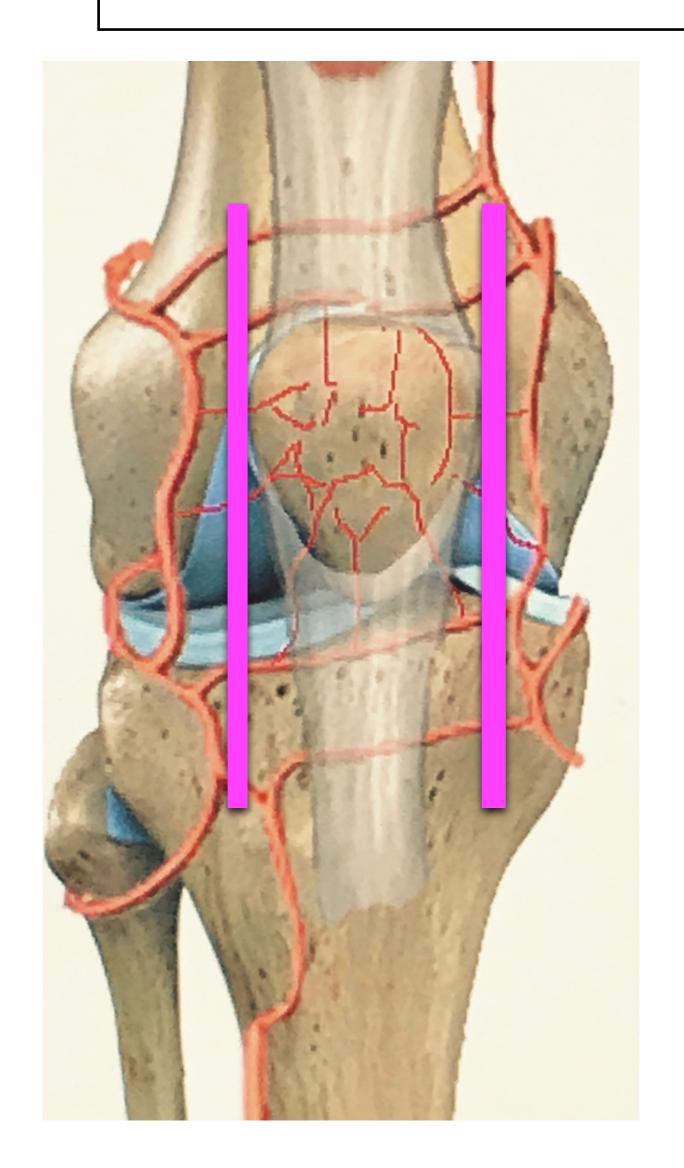

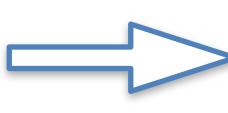

Co- morbidities

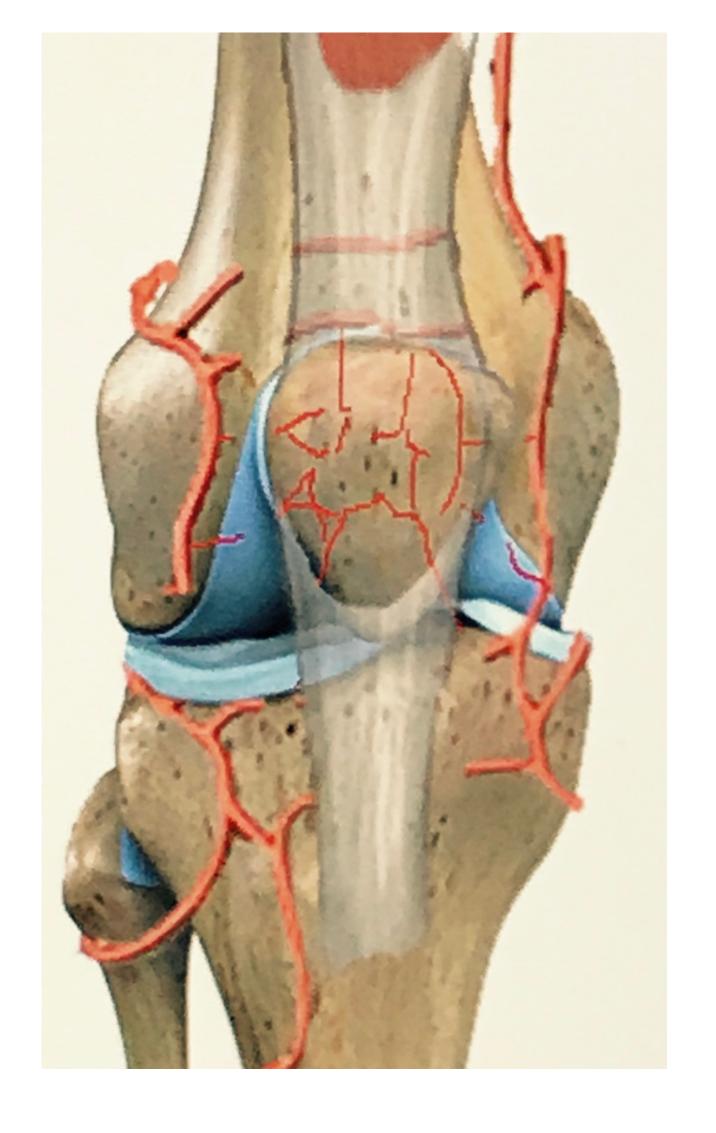

- Overweight
- Diabetes
- Rheumatoïd arthritis
- Renal failure
- Connective tissue disorder
- Vascular disease
- Medication: Quinolone, Statine, Stéroïde

Previous surgeries and the vascularisation TKP- MPFL- KJ- Insall

Consequences

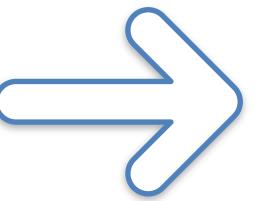

Patella fracture
Quadriceps tendon rupture
Patella tendon rupture (oste

osteonecrosis

skin status

- skin status analysis:
- Surgical incisions
- Quality and vascularisation

	TKP/chronic	Native	A
Patella Tendon	Achille Tendon Allograft	Semi T Augmentation Marlex Tape	
Patella	ORIf + Marlex Tape Extensor mechanisme Allograft	ORIF	
Quadriceps Tendon	Marlex Tape	Semi-T Marlex Tape	
Vascular problem or skin problem	+ Finn flap	+ Finn Flap	

Algorithme

My technique: Combinaison of Augmentation

+ Marlex tape + Fascia lata allograft over tape

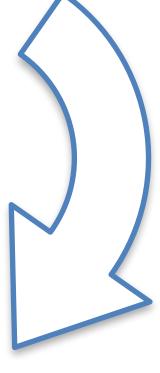

Results

Conclusion

- Only direct suture is no more the Gold Standard
- Augmentation is necessary
- Early mobilisation
- Not difference between the Augmentations
- Use the great strategy following the type of rupture, the comorbidities, the type of knee and the vascularisation skin status.
